Markdown versions of documentation pages are available by appending `.md` to page URLs; this page is available as Markdown (<https://docs.holybro.com/gps-and-rtk-system/m8n-m9n-m10-gps/dronecan-m9n-m8n/about-dronecan.md>).

About DroneCAN

DroneCAN

DroneCAN is the primary CAN protocol used by the ArduPilot and PX4 projects for communication with CAN peripherals. It is an open protocol with open communication, specification, and multiple open implementations.

Relationship with UAVCAN

DroneCAN was created to continue the development of the widely used UAVCAN v0 protocol. This protocol has proven itself as robust and feature rich and has been widely deployed in the commercial drone industry, and enjoys broad support among industry partners. The proposed introduction of the UAVCAN v1 protocol involved changes to UAVCAN that increased complexity and did not offer a smooth migration path for existing deployments. After extended discussions within the UAVCAN consortium, it was decided that the best solution was to continue development of DroneCAN v0 under the name DroneCAN.

DroneCAN Key Features

The first version of DroneCAN, known as DroneCAN v1, is identical to the existing UAVCAN v0 protocol. This means that the large number of existing UAVCAN v0 devices used throughout the drone industry are already DroneCAN v1 compliant. Features inherited from UAVCAN v0 include:

- * Detailed protocol specification
- * DSDL message description language for message description
- * DNA (dynamic node allocation) for assignment of CAN node IDs
- * Multiple open DSDL compilers that produce C and C++ bindings
- * Rich python implementation
- * Feature rich graphical user interface for diagnostics and device configuration
- * Mature implementations in ArduPilot and PX4
- * AP_Periph (<https://ardupilot.org/dev/docs/ap-peripheral-landing-page.html>) and PX4 can node (https://docs.px4.io/en/advanced_config/setting_up_a_can_bus_interface.html)

Continued Evolution

DroneCAN is a continually evolving protocol. Starting with DroneCAN v1, the protocol will evolve to add new features to assist in the widespread adoption of CAN throughout the UAV industry. The DroneCAN project is committed to ensuring this evolution is done in a manner that retains compatibility with existing DroneCAN devices.

Key features planned for DroneCAN in the near future:

- * Support for FDCAN, allowing for higher data rates and larger frame sizes
- * A node capability message to allow the DNA server to determine both the hardware and software capabilities
- * Support for extending message definitions while retaining compatibility with existing implementations
- * A comprehensive rework of existing DSDL message structures to improve efficiency and flexibility

Development

The DroneCAN project has an active development community.

- * Discussions on Discord at
- * Development on GitHub at

Querying This Documentation

If you need additional information that is not directly available in this page, you can query the documentat

Perform an HTTP GET request on the current page URL with the `ask` query parameter, and the optional `goal` query parameter:

```

GET https://docs.holybro.com/gps-and-rtk-system/m8n-m9n-m10-gps/dronecan-m9n-m8n/about-dronecan.md?ask=&goal=q

```

`ask` is the immediate question: it should be specific, self-contained, and written in natural language.

`goal` is optional and describes the broader end goal you are ultimately trying to accomplish on behalf of t

The response will contain a direct answer to the question and relevant excerpts and sources from the documentation.

Use this mechanism when the answer is not explicitly present in the current page, you need clarification or additional context, or you want to retrieve related documentation sections.
